Additional Information

*A wet soil type would be described as one with water within the top 8 inches of the surface consistently and frequent ponding on the surface. Moist would be consistent groundwater presence but rare to no ponding. A well drained soil is one that has high amounts of gravel or sand allowing quick infiltration of water. Signs of a well drained soil are ground water at a depth of several feet, no ponding, and typically located from floodplains to hillsides. A dry soil is typically a very well drained soil that infiltrates quickly and has a steep slope causing increased runoff and less retention. Soils are very complex and may not easily be categorized into one of these four generalized groups. If you have concerns for picking the right species please call and we will be happy to advise you.

**The wildflower mix bags can be used to create a dense patch in a flower garden or used sparingly by mixing with sand or grass seed to add variety to a disturbed area.

***For more detailed information on the wildlife boxes or any species please visit our website <http://dutchessswcd.org/>.

****The fertilizer tablets are a great way to provide a boost to new or existing shrubs and small trees. The essential nutrients to plant growth and vigor are nitrogen (20%), phosphorus (10%) and potassium (5%) and are all within the tablet at those percentages.

*****The Environmental Education Program helps the district to provide educational outreach to students from classroom workshops to the regional Envirothon competition.
